

APPLICATION RATE WHEN USING DIATOMACEOUS EARTH AS A NATURAL FERTILISER AND BARRIER FROM INSECTS

Dry application

Apply uniformly to foliage including underside of leaves. Dust when the air is still, preferably in the evening or early morning.

Apply more frequently during wet weather.

Wet application

Alternatively **add 1 scoop (30 grams)** to every litre of water and spray plants vigorously. DE will become active once dried.

Any run off of DE will then act as a natural fertiliser (see Using DE as a natural fertiliser for more information)

After applying you will see a layer of DE covering your plants, this will guarantee your plants are protected from the heat, frostbite and ALL Problems.

There is no withholding period of eating your vegetables or fruits when using diatomaceous earth food grade mineral.
